

3D UNIVERSITY

Posted on 23/10/2015 by Naider

Despite today 3D printers still do not occupy, as a general rule, space in the majority of homes and/or offices around us, the University of Deusto did not want to wait for this to happen and has opened a laboratory available to those who request it, both companies and students, baptized "Fablab" and oriented to production in three dimensions.

The center occupies the space left by an old carpentry and has the support of the Bizkaia Provincial Council and the Bilbao City Council. As the university explains, Fabllab is "a laboratory based on machines and shared technologies, which anyone can access and manufacture whatever they want".

This center will not only be used as a production center but will try to complement this activity with training with an educational program oriented to workshops, activities and training courses.
