

APPLE CATCHES THE SOAP

Posted on 23/10/2015 by Naider

Apple has decided to reduce toxic emissions from its plants in China and improve the energy efficiency of its plants. For this reason, it has begun to manufacture a sophisticated solar energy system that could provide them with up to 40 megawatts as of 2018, as Tim Cook, CEO of the multinational, has advanced on his last visit to the Asian giant.

The objective of the American company is none other than to minimize as much as possible the emissions generated by its

companies and China is presented as the first country in which they will implement this new policy.
