

AWESOME TECHNOLOGY

Posted on 25/07/2014 by Naider

MIT Media Lab is a research center within the School of Architecture and Planning at [Massachusetts Institute of Technology](#) (the famous MIT). The Media Lab is dedicated to research projects on the convergence of design, multimedia and technology.

He found thanks to [UppWhats](#), a video with what the MIT Media Lab calls *tangible technology* that allows three-dimensional shapes to be built remotely where the interaction with the user comes to the fore. Industrial and other applications are manifold. The video is very cool and can be seen with pleasure. It presents a remotely manageable three-dimensional panel, it seems like magic, but it is not.
