

BUILT INTELLIGENCE

Posted on 29/09/2015 by Naider

Mobile phones, watches and now also buildings, technology is once again "determining" to provide intelligence to its creations, the latest; "The Edge" building in Amsterdam. This building owned by the American Deloitte is capable of collecting information from users who work on a day-to-day basis to achieve the greatest possible efficiencies in terms of energy use, and adapt to the routine of workers by creating a pattern of efficient operation.

With this new system that, little by little, will be implemented in other buildings, it is expected to provide another response to the challenges that climate change poses to the planet, seeking sustainability and responsible energy consumption.

The Edge collects the information thanks to 28,000 sensors located throughout the building that collect data and information that it considers relevant, likewise, all building workers have an app in which they can write down the improvements they consider possible.
