

ELEMENTARY MY DEAR WATSON

Posted on 31/07/2014 by Naider

That computers are getting smaller is a reality, but the giant [IBM](#) is working so that they are getting smaller.

This multinational is working on the development of a microcomputer prototype the size of a smartphone and that integrates processors and circuits from large boards, trying to improve both the performance of memory applications and servers for analytical and cloud applications.

The first application that we are going to see of this new development in the passage of the [Watson supercomputer](#), a behemoth that can process 500 gigabytes per second (the equivalent of a million books), the size of a pizza box.
