

LESS DEPENDENCE THANKS TO ICT

Posted on 20/08/2014 by Naider

Researchers from the [Polytechnic University of Madrid](#) (UPM) participate in the European project *PERSILAA* that will develop and validate a new model of services for the detection and prevention of frailty in the elderly from the functional, cognitive and nutritional point of view.

The project *PERSILAA*, [PERsonalised ICT Supported Service for Independent Living and Active Aging](#), in addition to developing remote service modules and offering a technical support infrastructure to users, is committed to innovating in the way of providing these services, going from a model fragmented as the current one to a preventive one through a local community of caregivers supported by health professionals integrated into the health system.
