

MAP SAVES LIVES!!

Posted on 11/02/2015 by Naider

A new 3D map of Greenland is giving scientists a detailed look at its inner layers for the first time. This innovation is making it possible to see the past of this ice sheet and open new doors for the future and the climate change that is lurking.

Taking into account that it is the second largest mass of ice on earth and that it contains enough water to raise the level of the ocean considerably, the advance is a glimmer of hope.
