

NANOTECHNOLOGY FOR INDUSTRY

Posted on 12/08/2014 by Naider

The group [Materials+Technologies \(GMT\)](#), created at the San Sebastian Polytechnic School (UPV/EHU), has carried out research focused on the use of carbon nanotubes to improve the properties of resin coatings that are widely used in various sectors: aeronautics and the automotive industry, especially in structural parts of airplanes and cars.

Within the framework of the European POCO project, coatings based on [copolymers](#) have been generated, which present a greater stability than those based solely on [epoxy](#), thus generating more suitable and safe coatings for the industry.
