

NEXT STOP: SUSTAINABILITY

Posted on 02/09/2015 by Naider

It is never too late if luck is good, perhaps the Netherlands will not be able to reduce its emissions by 25% compared to those of the 90s, as I had thought, even so, it has been able to launch a project that combines new technologies and environmental sustainability.

If everything goes according to plan, 100% of the train fleet that the Netherlands has today will be powered by wind energy by 2018, quite a challenge.

And it is that the Netherlands is, without a doubt, one of the European countries that makes the most effort in the fight against climate change, an example for its neighboring countries.
