

NIGHT SUN

Posted on 23/09/2015 by Naider

Who said that the sun only rises during the day? It is true that we have not discovered a new solar orbit, what we have discovered are new solar panels made by the Technion company. The seemingly complex mechanism seeks to trap light in ultra-thin films of iron oxide that are 5,000 times thinner than a sheet of paper.

One of the biggest problems to date with solar panels was the difficulty in collecting solar energy when the sun was not present and at the same time being able to store the energy captured during the day. With these new solar panels, not only is a step in favor of solar energy taken, but it is further proof of the commitment that many companies today are beginning to give to alternative energies.
