

SUSTAINABLE FUTURE, POSSIBLE FUTURE

Posted on 09/07/2015 by Naider

According to the result of the last [study](#) by [The New Climate Economy](#), 2015 is presented as a unique opportunity to implement certain practices that will make it possible to achieve the objective that the Global Commission for the economy and the environment proposed for the year 2030.

This publication analyzes the role of both renewable and finite assets and proposes ten actions that governments and multinationals should respect and promote in order to achieve the objectives in this way.

Both the new energies and the political and business will seem irreplaceable on this path that, whether we like it or not, we must take to guarantee the environmental sustainability of the planet.

Changing the change is the way to not alter the ecosystem and, at Naider, we want to support this type of initiative.
