

THE MOST MOBILE CARS

Posted on 20/11/2015 by Naider

The internet of things advances without looking back, connectivity and interaction between devices, mostly mobile phones, is experiencing a boom that is difficult to match; Ford users will have the possibility to start their vehicle from their mobile phone thanks to the new technology created by the American firm called Sync Connect.

At the moment, the options that the mobile application will

make available to customers will be reduced to opening, closing, starting the car and checking the state of the car's water and oil, although it is not ruled out that the range of possibilities will increase as time passes and the brand's own technology advances.

This new model, named SUV, was presented at the Los Angeles Auto Show (USA) and will be available to the general public from 2016.
