

THE WIFI ALSO DROPS

Posted on 10/02/2016 by Naider

**Technology advances at the speed of light, never better said;
That's, at least, how the Lifi, Wi-Fi's near-term future
competitor, will travel. This new improvement in
telecommunications networks is capable of traveling at a
speed of up to 225 gigabits per second, while Wi-Fi can only
travel at one gigabit, as we can find out through Science Alert.**

**To travel at such speed, the lifi uses led light through a
sophisticated technology of the latest generation, for this, the
lifi appropriates the properties of light to transmit data at**

ultra-fast speeds that are not visible to the human eye.< /h3>

One more proof of how fast the world of technology and telecommunications in particular is advancing.
