

TO THE POSITIVE POLE

Posted on 11/09/2015 by Naider

As Goethe said, the law is powerful, but more powerful is necessity. The planet needs and needs alternative technologies to supply the at times unsupplyable energy demand that society requires. That is why we are happy to present a new device created by Jhostoblak engineers, capable of obtaining energy through electromagnetic forces that could supply the needs of a family without using fuel or atmospheric elements.

The device, similar to a television, does not make noise and works through a movement of fifth generation turbines that is produced by the effect of non-attraction of continuous electromagnetic fields.

This new system called EGS obtains energy similar to that which comes from thermoelectric and hydroelectric plants and would be capable of producing up to 120 kilowatts per day.
