

WELCOME TO THE ELECTRIC LANE

Posted on 21/08/2015 by Naider

A new proof that the future lies in electric cars; England is studying the creation of special lanes on the country's main highways capable of charging their batteries. The company that will be in charge of this if the project goes ahead is Highways England and one of the greatest advantages that this lane brings will be, without take into account the obvious advantages that electric cars bring to the environment, that the cars will not need to stop to charge their batteries.

The project takes the name of "Preparing the road networks for electric vehicles" as we can find out through [diarioecology](#) and it is a very important step for the sake of environmental conservation since it is a country whoever adopts the measure.

From naider we are happy with these actions and we hope that in the future, closer than distant, new countries will join them.
