WHAT IS A SUSTAINABLE CITY?

Posted on 09/02/2015 by Naider

We already know that the theory about the cities of the future is something that almost everyone knows, but from time to time it is not bad to remember it again. What is a sustainable city of the future and what it should be like are the questions answered in this video that we rescued from YouTube.

We are facing three main challenges:

1. Transform the buildings in which we live towards a sustainable model;
2. Change the form of transportation;
3. Getting to provide smart grids for the distribution of electricity.

Very nice theory and video that the sooner we start applying them and develop an intelligent urban approach, the better it will be for us in the future.
