

COST AND BENEFITS OF THE PARIS AGREEMENT ON CLIMATE CHANGE

Posted on 15/03/2019 by Naider

A [new UN report](#), produced over the past five years by a team of 250 scientists and experts from more than 70 countries, shows that for climate change mitigation policies to be effective, they must address entire systems – such as energy, food and waste – rather than specific problems – such as water pollution. For example, a stable climate, clean air, and good health are interconnected outcomes. Therefore, despite the fact that climate mitigation measures to achieve the objectives of the Paris Agreement **would cost around 22 trillion dollars**, reducing air pollution would bring **health benefits of 54 trillions of dollars**.
