

# NAIDER BEHATOKIA: AN INTERACTIVE TERRITORIAL DIAGNOSIS OF THE BASQUE COUNTRY

*Posted on 04/09/2025 by Naider*

The observatory provides a clear and structured view of the territory through **dynamic charts** and **thematic maps**, helping users to grasp data quickly and make better-informed decisions. Targeted at public administrations, local stakeholders, and territorial analysis professionals, the tool combines technical rigor with advanced usability.

**NAIDER Behatokia** is an innovative visual analysis platform that offers an intelligent reading of more than **120 territorial indicators** drawn from the Basque Government's official **UDALMAP** system. Thanks to its interactive navigation, the dashboard makes it easy to explore, compare, and understand the socio-economic reality of the Basque Country at **provincial, regional, and municipal** levels.

We use the Udalmap API to automatically connect to databases, structuring them and linking them with fact tables. This enables us to establish advanced metrics such as smart readings or narratives that take into account comparability between municipalities and counties, forward-looking projections based on data from recent years, weighted averages, and a set of data segmentation parameters that allow for a customised selection of indicators, municipalities, counties, and provinces across the Basque Country.

Discover NAIDER Behatokia and turn data into knowledge for action:
