VIT NAIDER: TERRITORIAL INTELLIGENCE VIEWER FOR BASQUE MUNICIPALITIES

Posted on 03/09/2026 by Naider

VIT NAIDER — the Territorial Intelligence Viewer — is a territorial analysis tool developed by NAIDER that integrates data from the Basque Government's official **Udalmap** system. Through an interactive interface, the dashboard enables analysis of the competitiveness and sustainability of Basque municipalities at district and local level.

The panel offers a clear, structured view of the territory through **trend charts**, **thematic maps** and **data tables**, making it easier to grasp information quickly and make more informed decisions. It is designed for public administrations, local agents and territorial analysis professionals, combining technical rigour with advanced usability.

VIT NAIDER allows users to filter information by theme group, sub-group, historical period, district and municipality, and provides a relative position for each indicator through a **percentile system**, placing each territory within the overall distribution without implying a value judgement in itself. Each entry combines the historical series with a **direct comparison between the municipality, its district and the Basque Autonomous Community as a whole**, as well as a **technical trend projection** looking ten years ahead, offering an indicative reading of each indicator's expected evolution. Results can be exported as a customised report in PDF format.

Explore **VIT NAIDER** and turn data into knowledge for action:
