Bilbao City Council now has a **viewer for monitoring the Bilbao 2050 Environmental Strategy**. Developed as part of the technical support provided for the strategy, the tool brings together the indicators for its four pillars (**carbon neutrality, flood risk, heatwaves and environmental health**) and places them on a **3D map** of the city.

Going beyond periodic monitoring reports, the viewer makes it possible to move from the overall picture of the municipality to what is happening in **a specific neighbourhood, street or building**. In each case, it relates the indicators to the surrounding population, housing, economic activity or green infrastructure. The information is updated automatically from **official sources**.

The tool also includes **simulation capabilities**. Users can test energy retrofit measures, heat adaptation responses or renaturalisation proposals, and **estimate their effects before deciding where and how to intervene**.

Further details on how the viewer works can be found on the [project page on NaiderLab](#), together with the [tool's dossier](#) (in Spanish).
