NAIDER has presented to [Alcoi City Council](#) the monitoring system developed for Action C3 of the [AlcoiBioUp!](#) project. The system is designed to measure, in a structured way, the results of urban renaturalisation actions and to ensure its continuity as a municipal management tool.

During the session, we outlined the architecture of the indicator system established by [Fundación Biodiversidad](#), structured around key dimensions such as intervention areas, urban biodiversity, ecological connectivity, climate resilience, environmental and social co-benefits, and a gender perspective. The system integrates official georeferenced sources, municipal inventories, remote sensing and surveys, providing a robust baseline and enabling the objective assessment of results over time.

The presentation highlighted that the project not only promotes physical renaturalisation interventions, but has also incorporated a data-based monitoring infrastructure designed to evolve into a permanent municipal monitoring platform. In this regard, the importance of maintaining measurements beyond the project's completion was underlined, in order to consolidate renaturalisation as a structural public policy, improve planning and investment prioritisation, strengthen accountability and support local climate change adaptation.

The meeting was attended by Toni Francés Pérez, Mayor of Alcoi; Vanessa Moltó Moncho, Councillor for Finance and Urban Planning; Aroa Mira Rojano, Councillor for Inclusive Policies, Citizen Participation, Older People and Childhood and Adolescence; Raül Llopis i Palmer, Councillor for Climate Emergency, Public Safety, Emergencies and Civil Protection; Carles Samper Sánchez, Head of the Environment Department; and Maria Adam Cuixeres, AlcoiBioUp! project technician.
