Naider has presented a proposal for the development of a climate risk analysis and adaptation strategies in the municipality of [Quart de Poblet](#), in the metropolitan area of Valencia. This project, based on the [CLIMAAX](#) methodology, will allow a comprehensive assessment of the risks associated with phenomena such as floods, droughts, heat waves and forest fires, which affect both infrastructure and the local population.

This first-of-its-kind local study will provide detailed and contextualised data that will serve as a basis for the development of localised and effective adaptation strategies. It will also raise awareness among the population and key community stakeholders, fostering social awareness and collective commitment to implement preventive measures and build a more resilient future for Quart de Poblet.
