The [Visor Udalmap](#) is now available on our website — an interactive panel developed by NAIDER that allows users to analyse the competitiveness and sustainability of the Basque municipal landscape, drawing on data from the [Basque Government's Municipal Information System](#).

The panel brings together a wide range of indicators (demographics, mobility, the economy, among others) for each Basque municipality, with the ability to filter by district, compare against the regional average, and track change over time through its active context system. It also includes integrated diagnostics and strategic reports, along with the option to export results as a customised report.

The tool is aimed at professionals in the public sector, local development and strategic consultancy who need to turn open data into actionable knowledge.
