The first week of December we were in Pisa, Italy, at the first face-to-face meeting of the European SCORE project, in which we co-led a work package. There were two intense days of meetings in which we worked with the different partners of the project in the approach of the technical models that we are going to develop in the coming years. SCORE seeks to improve the climate resilience of 10 coastal cities and to this end we are working on risk models, climate forecast models, even in the approach of a Digital Twin that represents urban environments. It was a real pleasure to work closely with entities such as LAMMA (environmental monitoring and modeling laboratory), UNIPI (University of Pisa), IT-SLIGO (Sligo Institute of Technology), MBI (telecommunications systems and technological innovation center) , UCD (University of Dublin).
