Last Friday, Naider took part in the presentation of the **Digital Twin** developed for the living lab (CCLL) of Oarsoaldea, within the framework of the [European SCORE project](#). During the session, the platform was showcased through a live demonstration, followed by collaborative simulations with the stakeholders in attendance.

This innovative tool is designed to **predict the impact of extreme weather events under future climate change scenarios** in the Oarsoaldea region. It also enables the assessment of the potential effects of implementing various Nature-Based Solutions (NBS) to mitigate those impacts.

The session concluded with a participatory workshop where stakeholders from different sectors — public administration, education, and private industry — reflected on the potential uses and applications of the Digital Twin. It was a highly engaging and insightful event that sparked valuable discussion and collaboration.
